MoFSC	Ministry of Forest and Soil Conservation
CF	Community Forest
CFUG	Community Forest User Group
LFUG	Leasehold Forest User Group
BZ	Buffer Zone
NFD	National Forest Database
NFIS	Nation Forest Information System
DFO	District Forest Office
DSCWM	Department of Soil Conservation and Watershed Management
CFMR	Community Forest management Regime
LHFMR	Leasehold Forestry Management Regime
CoFMR	Collaborative Forest Management Regime
PFMR	Private Forest Management Regime
RFMR	Religious Forest Management Regime
PrFMR	Protection Forest Management Regime

# **1. Introduction**

## **1.1 Scope**

The scope of this document is to provide an architectural overview of the National Forest Database (NFD) and National Forest Information System (NFIS), database design and available applications. In doing so this document will capture and convey the infrastructure and high-level database design which forms the basis for the key NFD NFIS system components and the External or public facing application.

## **1.2 Purpose**

The purpose of the NFD is to provide the different forest management regimes at the MFoSC a repository of data on forest resources, forest management, carbon stocks, forest users and REDD+ activities. The NFD is designed to include data at VDC or range post level for data relating to forest inventory survey with tree level details, forest users and their activities. The web-based NFIS provides access to the NFD for analysis and reporting at national and sub-national levels. Data Entry Module is also integrated with the NFIS to facilitate submission of data by authorized staffs at district or departmental level.

The public facing NFIS application provides extensive query capabilities against the underlying database. The target audience for the NFD includes any person capable of accessing the Internet; however the primary users are those within the Ministry and its departments and divisions. Other users would be the forestry community and forestry research.

## **1.3 Assumptions and Dependencies**

The following is a list of identified assumptions and dependencies for the NFD NFIS System.

Assumptions:

- The NFIS interface to the NFD database system will be constructed as a web site.
- The features intended for the departments and the public will be accessible on the Internet.
- System security will be from the NFIS interface based on authentication of users.  
System security will be based on authorization granted to departmental staffs for data entry and manipulation.

Dependencies:

- The NFD has no dependencies on any other existing systems in the departments.
- The NFD will store the integrated data taken from all the existing databases of all management regimes supported in the project and NFIS will utilize the data.
- The NFD will store data collected from the pilot western development region and NFIS will utilize the data.

## **1.4 Key objectives**

The key objective of this document is to provide a high-level overview of the NFD data integration and system architecture and NFD data models to support the database design.

## 2. System Architecture

### 2.1 System Overview

#### 2.1.1 Methodology for Data Integration and Database Design

The methodology that will be used to achieve the above data integration task will be based on our understanding of the intended scope of work and deliverables, proposed time schedule of **approx. 5 months** for the program and on our collective and considerable experience in the articulation and implementation of work plans.

The proposed approach and methodology is focused on the outcome of development of NFD database and REDD+ Information System for Nepal (for example - control and management on carbon credits by visualizing carbon stocks and flows) and not just on the output of merely implementing improved database systems and processes and creating a National Forest database and REDD+ Information System.

The work will be rigorously focused on the implementation of the project, over the 5 months, working in conjunction with the participating stakeholders. The final 4 weeks of the project will focus on transitioning the IT system responsibilities to appropriately trained staff of the REDD+ team for ongoing coordination of implementation efforts.

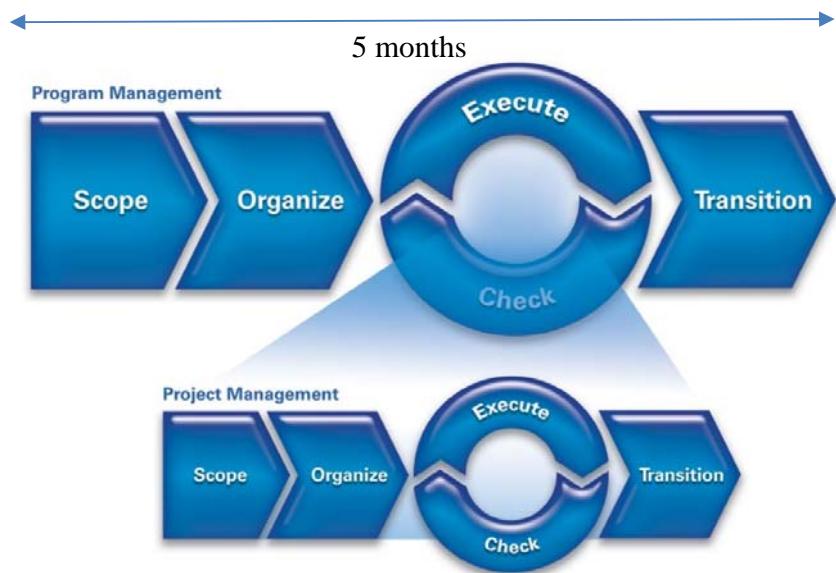

Figure 1 Program and Project Management Framework

The tasks involved as per the ToR includes development of Component A: National Forest Database (NFD) and Component B: National REDD+ Information System. Even though they are two separate components the methodology we use needs to demonstrate how the output will be achieved for both and the inter-linkages acknowledged. Thus, the development process methodology needs to be sympathetic to understanding of the inter-linkages between the two components.

The proposed methodology consists of Program and Project Management framework [1] bringing together two distinct disciplines: Program and Project Management as shown in diagram above. Program Management and Project Management are often grouped together because of their intrinsic relationship. In this context, the Program Management will attempt to capture the synergies and value among project components i.e NFD and NFIS, whereas Project Management will be concerned with executing them individually in the most efficient and effective way possible.

Figure 2 Program and Project Management Framework Details

### **Scope Phase (Two Weeks)**

The primary objective of the **Scope phase** will be to create and gain agreement on a project charter. The project charter will help establish the scope and objectives of role of Database expert as per the ToR, as well as other key variables, including the timeline

distribution, assumptions, constraints, roles & inter-linkages of roles with other team members and performance requirements associated with the project ToR.

Additional objectives of this phase will include:

- To identify key stakeholders and initiating communications;
- To initiate roles and responsibilities and inter-linkages of tasks with other team members
- To establish performance requirements and metrics.

### ***Organize phase (Two Weeks)***

The primary objective of the **Organize phase** will be to methodically create and establish plans and procedures for managing the project from its execution through to its close and transition.

This will be accomplished through the pursuit of **three objectives**:

- To create a project plan that efficiently and effectively addresses the project's ToR deliverables through combining the task distribution and timeline.
- To create the administrative plans that will provide the necessary supporting infrastructure.
- To create the project management plan, which will assist with project oversight.

### ***Execute phase (4 Months)***

The primary objective of the **Execute phase** will be to initiate the project work, as well as its administrative support plans and control processes/check-points.

This will be accomplished through the pursuit of **three objectives**:

- To secure required resources (access to all data and databases), infrastructure (server, networks, etc.). This may require some degree of administrative approval process to get access to the data and for procurement and setup of the needed infrastructure.

- To report on the inception.
- To define the project check-points.

## Agile Methodology

It is important that we make maximum and effective use of the significant quantity of technical detail and information for Implementation during both planning and throughout the implementation and operational phases by bringing in agile methodologies as shown in figure below rather than using the traditional waterfall methods.

### ***Check phase (2 Weeks)***

The primary objective of the **Check phase** will be to accumulate progress and completion data for the project and create reporting that provides useful information to Team Leader and other project leadership to conduct effective monitoring.

This will be accomplished through the pursuit of **three objectives**:

- To accumulate work in progress and completion data from work completed on both components of NFD and NFIS as per the ToR defined for the experts in a timely and complete manner.
- To create transparent and useful progress reporting, which will be provided to Team Leader and other project leadership to support effective monitoring and decision making.

### ***Rollout and Acceptance Testing***

Specific planning, design, set-up, operation and interpretation of tests require both the approved REDD cell specification of requirements. Accordingly, the database expert will provide following Acceptance Testing.

- (1) to define acceptance scenarios, specific tests, expected test results, and test plans,
- (2) to build test environments,
- (3) to conduct tests and compare expected results to actual results, and

(4) rerun tests as necessary to, eventually, obtain acceptance.

The acceptance testing shall include:

- Physical infrastructure at the main and back data centres;
- Fit out of the main and backup data centres;
- Technical infrastructure implementation at the main and backup data centres;
- Fail-over operations from main to backup and restoration of normal services;
- Implementation of NFD Data warehouse and NFD database;
- Customized and configured application software solution for all NFD business function sets (and any associated non-functional requirements)

The System Testing Methodology (STM) [2] that is proposed will address the complexity of software testing from organizational aspects, including people, processes, technology and risk management. The STM closely follows the software development life cycle and is organized into testing phases, which include Requirements, Design, Build, Validate, and Deploy and Maintain. A graphic of the STM Framework is shown below.

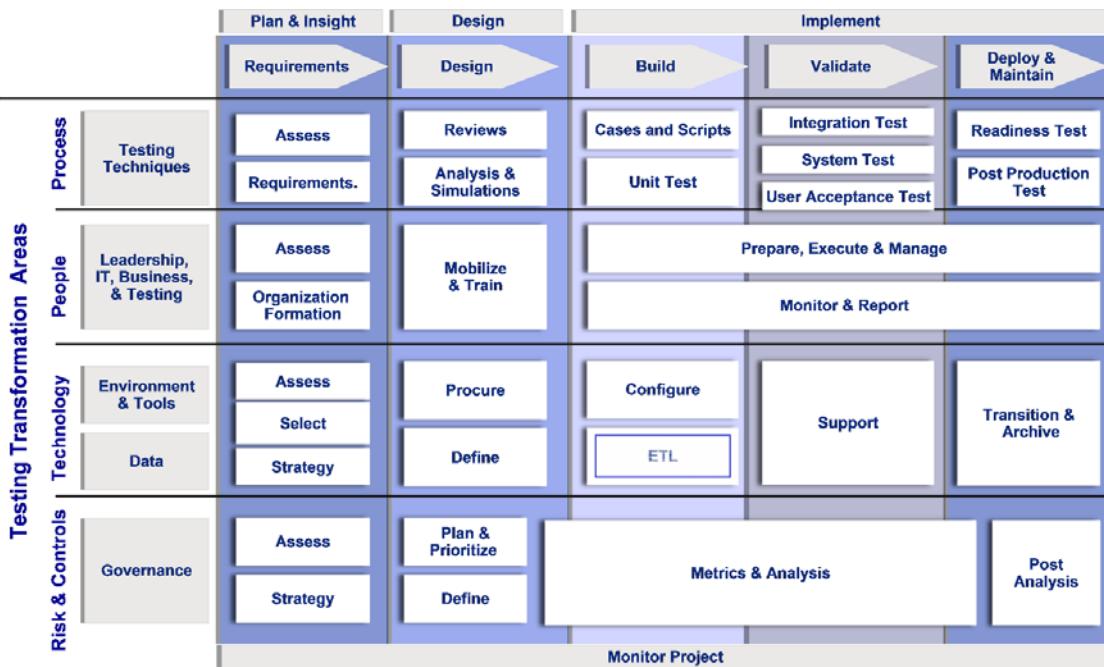

Figure 3 System Testing Methodology (STM) Framework

## STM Phases – Requirements, Design, Build, Validate and Deploy

The STM will be developed in relation to the software development life cycle (SDLC). Below is a high-level breakout of testing activities in each phase.

### Requirements

- Establish and align testing objectives and goals with vision
- Assess testing to identify improvements
- Develop Testing Strategy
- Develop Test Data Strategy
- Secure and mobilize internal and external testing resources
- Evaluate and select testing tools
- Design testing environment to support testing strategy

### Design

- Train resources on testing tools and techniques
- Procure testing tools and environment components
- Conduct software reviews and validations
- Develop, simulate and evaluate models based on software design

- Establish and help improve governance processes and procedures to be used in testing
- Define test data requirements

#### **Build**

- Conduct Unit Testing with static and dynamic testing techniques
- Continue to execute simulations and discuss recommendations with development team
- Develop metrics and reports and initiate testing progress and result reporting
- Configure and shakeout Integration, System and Non-Functional testing environments
- Develop test cases and scripts
- Perform Extract, Transform and Load activities

#### **Validate**

- Execute testing
  1. Integration
  2. System
  3. Performance and other non-functional testing
  4. User Acceptance Testing
- Conduct daily and status meetings with team
- Perform defect management and triage
- Monitor and control test execution

#### **Deploy and Maintain**

- Conduct Readiness Testing
- Execute Production Testing for patches and other system changes
- Conduct post-test analysis and capture lessons learned
- Perform ongoing monitoring and continue model simulations with production data
- Archive testing results as appropriate

### ***Transition phase (1 Month)***

The primary objectives of the **Transition phase** will be to administer the close of the project and execute the transition of the deliverables or ongoing operations to the appropriate parties within the **REDD cell team**.

This will be accomplished through the pursuit of **four objectives**:

- To create, communicate, and initiate close procedures in relation to the already existing Transition Plan.
- To conduct final performance analysis and conduct a lessons learned exercise to gather process improvement information.
- To dispose of infrastructure, release or disband resources, and close the tasks.
- To execute the Transition Plan and conduct a close meeting in order to formally communicate the end of the project.

The **final phase** will include administrative and engagement closure activities from Database perspective. The administrative activities will include finalizing the work papers (including handing over all access information such as username and passwords in sealed envelopes, etc.,) and handing over of performing review assessments. The key step in this phase is to formally communicate and conduct engagement closure for role of Database expert.

Significant benefits will come from major change, and significant change always brings uncertainty and potential for resistance. Effective change management will, therefore, need to be integral to any implementation strategy – to balance a focus on support and engagement for the individuals and stakeholders involved as a priority, alongside plans for the technical and physical rollout of any new equipment or systems. There will be many individuals directly affected by the introduction of the NFD and NFIS, and many more that will have some indirect interest in it. For this reason communications and change support (including capacity building and training) will need to be segmented and tailored to meet the needs of classes of stakeholders as well as the needs of the individuals involved.

Because of the diverse nature of NFD and NFIS impacts, the change and communications program elements of implementation will need to be delivered centrally as well at an individual department level of MoFSC. It is important we identify from each department within MoFSC some senior implementation change sponsors as part of the overall NFD and NFIS implementation plan. In summary, the successful introduction of NFD and NFIS will require timely and effective communications, engagement, marketing, training,

facilitation, monitoring and staff and technical support strategies. It will also require a mechanism for central and regular monitoring of the progress of change initiatives (and of implementation more generally) to ensure coordinated and effective use of available resources and to embed a “review and improve” approach to the changes. These will need to commence immediately – with engagement and communications to inform any final decisions about the functional and technical specifications and will need to continue for at least the first three months of implementation.

The Transition Change Implementation (TCI) methodology [3] proposed will implement the changes required (as per the detailed design and implementation plan) in order to prepare the client/REDD Cell for ‘go live’ of NFD and NFIS.

The ‘go-live’ is the point in a transformation when a series of coordinated initiatives for NFD and NFIS will affect real change for client/REDD Cell and stakeholders; in effect, at go-live the client/REDD Cell and stakeholder implementation change will be implemented and the organization will be operating under the new model/way of working. A great deal of work will have been undertaken before reaching ‘go live’, for example confirming that:

- The proposed changes are in line with the NFD and NFIS strategy.
- The change will deliver required benefits.
- The new business processes have been appropriately designed.

There is a risk of failure if the implementation phase is rushed or conducted ineffectively. Sustaining the change, and therefore realizing the full benefits, once attentions and focus have been diverted, post-transformation is also a challenge (for example when consultancy is disbanded).

TCI covers the components that directly influence the success of the implementation. Of these components, several occur before the go-live point, several are involved in the go-live itself and others relate to activity that occurs post go-live. This section will describe these activities and signpost readers to methods and other elements that cover these three stages in more detail.

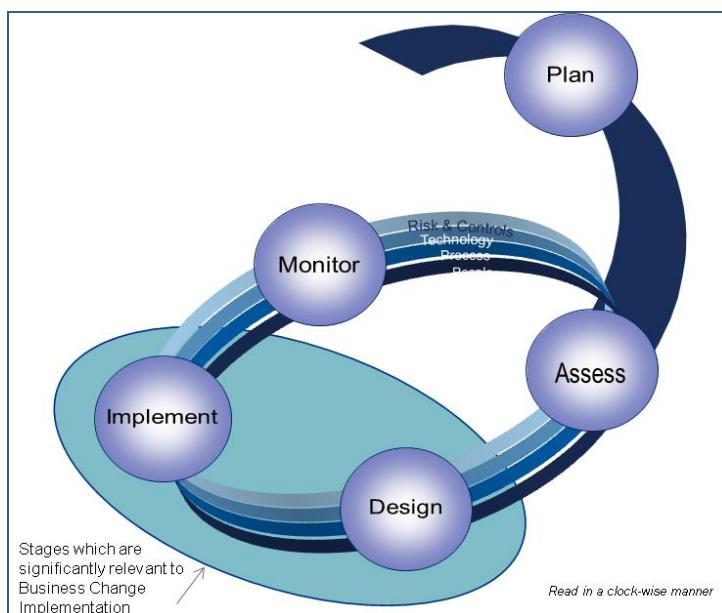

The main focus for TCI is:

- to implement the detailed program plan (covering all component initiatives) and make preparations for ‘go-live’ whilst ensuring that the organization is ready for the change
- to build client ownership for the change.

Given the importance of the go-live within a change program, as well as the extensive preparation and ongoing monitoring required, the start and end points of the TCI element should be set for approx. 3 days each month for the first 4 months with more days assigned in the last month of the project.

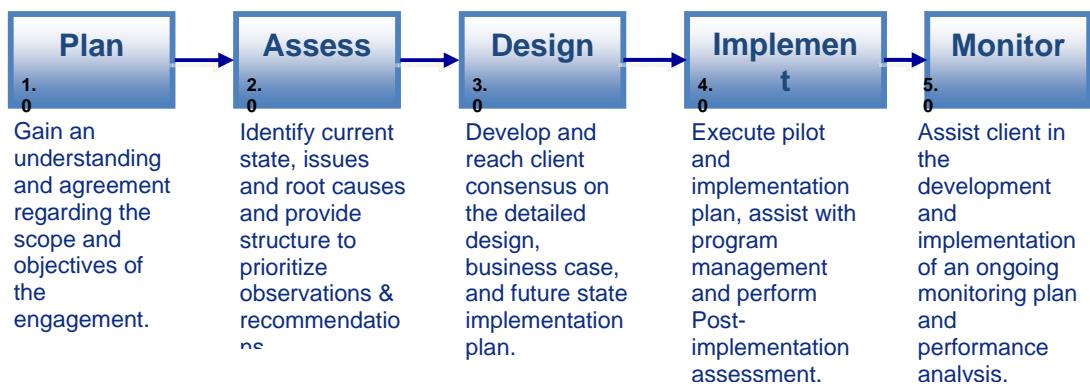

### **Transition Change Implementation Methodology**

The proposed Transition methodology will provide guidance in adoption of new processes, controls, and the implementation of new business processes to help achieve the objectives and performance improvement results.

*Figure 4 Transition Stages*

TCI stages: The TCI process has five phases:

The ‘Implement’ phase is the most relevant because it provides guidance on the activities required to implement a change program successfully:

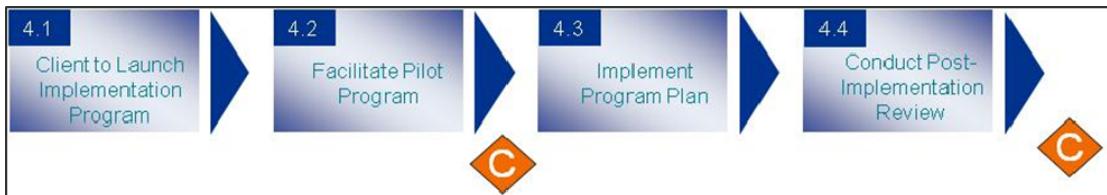

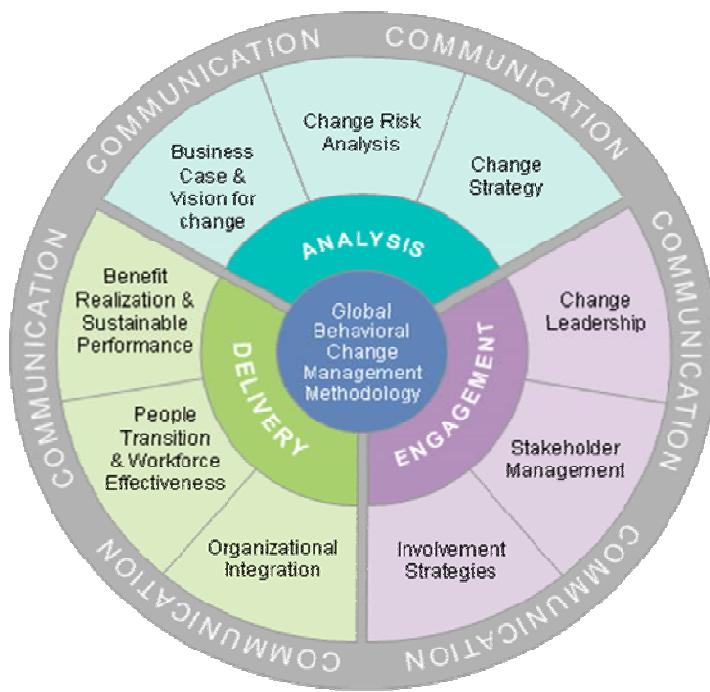

Figure 5 Implement phase overview

The TCI Methodology provides guidance for on the ‘behavioral change’ required for successful transition. The proposed new NFD and NFIS system will involve the adoption of new processes, the implementation of new business models to achieve performance improvements. The proposed Behavior Change Model will provide an overview of the TCI methodology’s three stages (Analysis, Engagement, and Delivery), nine model elements and reflects the iterative nature of Behavior Change Model, for example, communication is shown as an ongoing activity that is required constantly with stakeholders:

*Figure 6 The Behaviour Change Model part of TCI Methodology*

### **The Behavior Change Model part of TCI Methodology**

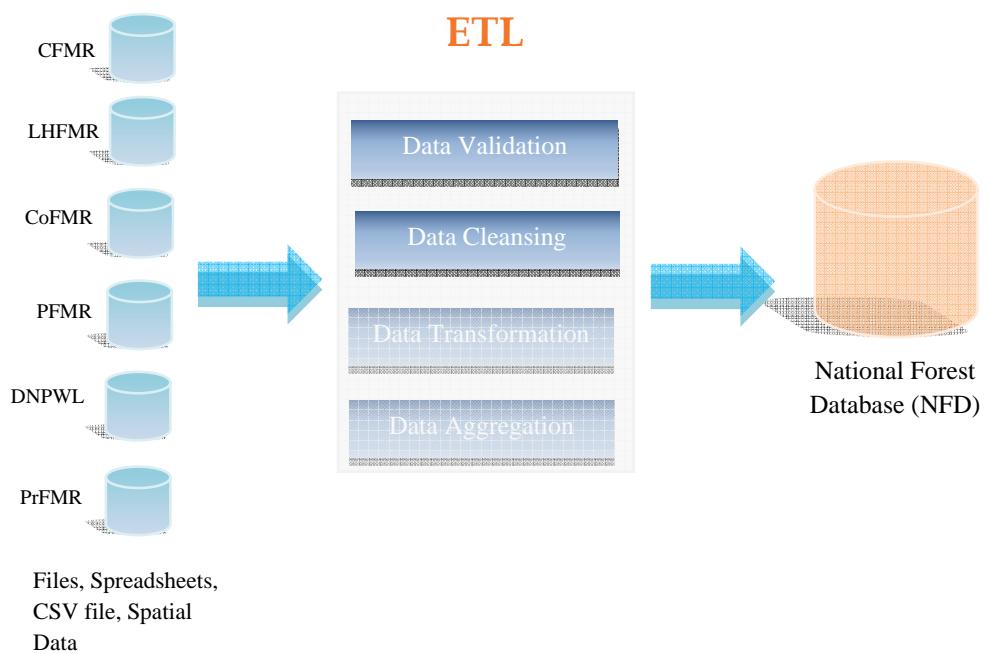

Behavior Change Model will be key in relation to implementing the required business change for NFD and NFIS implementation, because it will provides the tools and approaches required to help REDD Cell and MoFSC in general through the transformation stages. As such, the Engagement and Delivery segments of the Behavior Change Model wheel as shown in diagram above are the most relevant to TCI Methodology.

***Transition Change Management is about getting people ready, willing and able to continue sustainable benefit of NFD and NFIS.***

#### **2.1.1 Data Integration Architecture**

The data integration architecture is shown in Figure 7. As proposed at the inception phase, we performed the Extract, Transform and Load (ETL) process to achieve the aim of Data Integration. We designed the National Forest Database, which is a transactional database that also acts as a data warehouse holding data from all the sources in a structured manner. Data available from all the management regimes as shown in Figure 7 are being processed for ETL and stored in the NFD.

- **Data available:** The available data are the existing data collected at central level and data collected at DFOs of the pilot region. The data are in the form of files, spreadsheets and CSV files that consists of information on community user groups and social data, operational plan information, general forest information, location data on forest boundary, growing stock information, forest composition and inventory, forest product supply and demand and forest regeneration.

*Figure 7 Data Integration Architecture*

→ ***ETL Process:*** The five steps of ETL process is described below:

**Data Validation:** Selecting only certain columns to load: (or selecting null columns not to load). For example, if the source data has two columns (also called attributes), operational plan approval date, and fiscal year, then the selection may take only approval date. Similarly, the selection mechanism may ignore all those records where approval date value is not present (approval date= null). (Strict validation may not be carried out in our case for missing data or null values as it is assumed that the records would be update by the authorised user/s using the data entry module).

Applying any form of simple or complex data validation. If validation fails, it may result in a full, partial or no rejection of the data, and thus none, some or all the data are handed over to the next step, depending on the rule design and exception handling. Many of the above transformations may result in exceptions, for example, when a code translation parses an unknown code in the extracted data. The validation may be strict (such as rejecting any address that does not CFUG code) or fuzzy (such as correcting records that partially match existing, known records).

**Data Cleansing:** Detecting and correcting (or removing) corrupt or inaccurate records from a record set, table, or database. This process will involve identifying incomplete, incorrect, inaccurate, irrelevant, etc. parts of the data and then replacing, modifying, or deleting this dirty data or coarse data.

Data cleansing may also involve activities like, harmonization of data, and standardization of data. For example, harmonization of short codes (na.pa etc.) to actual words (Municipality). Standardization of data will involve changing a reference data set to a new standard, example use of standard codes.

Data cleansing differs from data validation in that validation almost invariably means data is rejected from the system at entry and is performed at entry time, rather than on batches of data.

The actual process of data cleansing will involve removing typographical errors or validating and correcting values against a known list of entities.

Also data enhancement can be part of the process, where data is made more complete by adding related information, and this is a common data cleansing practice. For example, appending data entry/updating time and location information which may not be present in current databases.

*Data Transforming:* Translating coded values: (e.g., if the source system stores 1 for male and 2 for female, but the warehouse stores M for male and F for female). Splitting a column into multiple columns (e.g., converting VDC name and ward numbers (a comma-separated list), specified as a string in one column, into individual values in two different columns – e.g., splitting vdc name and ward numbers)

*Data Aggregating:* Aggregation (for example, rollup — summarizing multiple rows of data — total forest for each VDC, and for each District, etc.)

*Data Loading:* Load phase interacts with the data warehouse database, the constraints defined in the data warehouse schema as well as any triggers activated upon data load will apply (for example, uniqueness, mandatory fields), which also contribute to the overall data quality performance of the ETL process.

→ ***National Forest Database (NFD):*** The National Forest Database is designed to hold data from all the management regimes in the MoFSC departments. The NFD is a relational database and thus the collected data items from all the management regimes are organised as a set of formally described tables and relationships. The data from NFD can be accessed or reassembled in many different ways without having to reorganize the database tables. NFD is easy to extend in future if necessary, as a new data category (tables, attribute) can be added without requiring to modify all existing application.

### 3. Data Model of NFD

This section describes the physical model of the NFD database. The physical model is described in terms of the database tables and data dictionary, the physical organization, database constraints and triggers, indexes.

#### 3.1 Database Design and Physical Data Models

Detailed Physical Data Models that will contain Table Models and Data Dictionary

- Name of each table and column (relational databases), or schema
- Domain values, physical data type, length and null ability of each column or field.
- Unique keys and indexes

Name	Value
Name	National Forest Database
Data Model	Physical

Detailed description of each table is provided in the document titled System Analysis and Design- Part 2.

#### 3.2 Data Dictionary

tbl\_community\_forest\_usergroups

Name	Value
Data Model	Physical
Schema	public
Primary Key Constraint Name	tbl_community_forest_usergroups_pkey

*Columns Summary*
